

Figure 1 consists of six sub-graphs labeled (a) through (f), each plotting concentration (mg/L) on the y-axis against time (h) on the x-axis from 0 to 12 hours. The graphs show the pharmacokinetic profiles of cefazolin sodium and its metabolites under different dosing regimens. (a) shows a single peak for cefazolin sodium. (b) through (f) show more complex profiles with multiple peaks and troughs, indicating the effect of repeated dosing or different formulations. The concentrations generally decrease over time, with some graphs showing a secondary peak or a more prolonged release.
